<sup>2</sup> Global Institute for Environmental Research (GIER), University of Newcastle, NSW

# OUTLINE

- Background and Introduction.
  - Most dangerous contaminants
- Treatability case study for a Project Site
  - AFFF contaminated wastewater using matCARE™
  - AFFF contaminated soil using matCARE™
  - Cost of remediating
- Q & A

**matCARE™ : CRC CARE PROVEN TECHNOLOGY FOR AFFF TREATMENT**

# MOST DANGEROUS CHEMICAL CONTAMINANTS

- Arsenic
  - Lead
  - Chlorinated hydrocarbons
  - PH
  - Asbestos- mineral
  - Cr(VI)
- Others – recent
    - PFCs

# PERFLUORINATED CHEMICALS (PFCS)

- **Aqueous Film Forming Foam (AFFF)**

- has been widely used for fire-fighting by the military and many fire departments.
- composed of hydrocarbon surfactants, hydrofluorocarbon surfactants, and aluminum salts. It can lead over time to the formation of hydrophobic fluorinated films that smother and extinguish flames.
- The toxicity of AFFF is due to the presence of a mixture of partially-fluorinated hydrocarbons and surfactants that results in the formation of persistent perfluorinated chemicals from partially-fluorinated precursors.”

**Persistent in the environment. Known to bioaccumulate in the food chain**

## PERFLUORINATED CHEMICALS (PFCS)

- **Perfluorooctanoic Acid (PFOA) and Perfluorooctane Sulfonate (PFOS)**

Manufactured since  
1940's

Used in aqueous film-forming foams (AFFF), fire suppression systems, hangars, fire trucks

– Fully

not

er

– Very stable chemicals that have both lipid- and water-repellent properties.

# THE PROBLEM

- Issues associated with AFFF containing PFCs
  - Bioaccumulates in higher trophic level organisms through the aquatic food chain (Budakowski et al., 2004)
  - Persistent: very stable chemicals that do not change or break down
- Effects on human health (Key et al., 1997)
  - stay in the human body for many years.
  - toxic to the liver and thyroid gland and
  - may also affect fetal and neonatal development.

# THE PROBLEM

How PFCs reach the environment?

When spilled or disposed of, PFCs found huge exposure into the ground water, soils and sediments around a large number of fire training areas (Johnson et al., 2007).

Once in groundwater PFCs can easily move long distances, potentially affecting nearby water supplies.

# POINT AND NONPOINT SOURCES

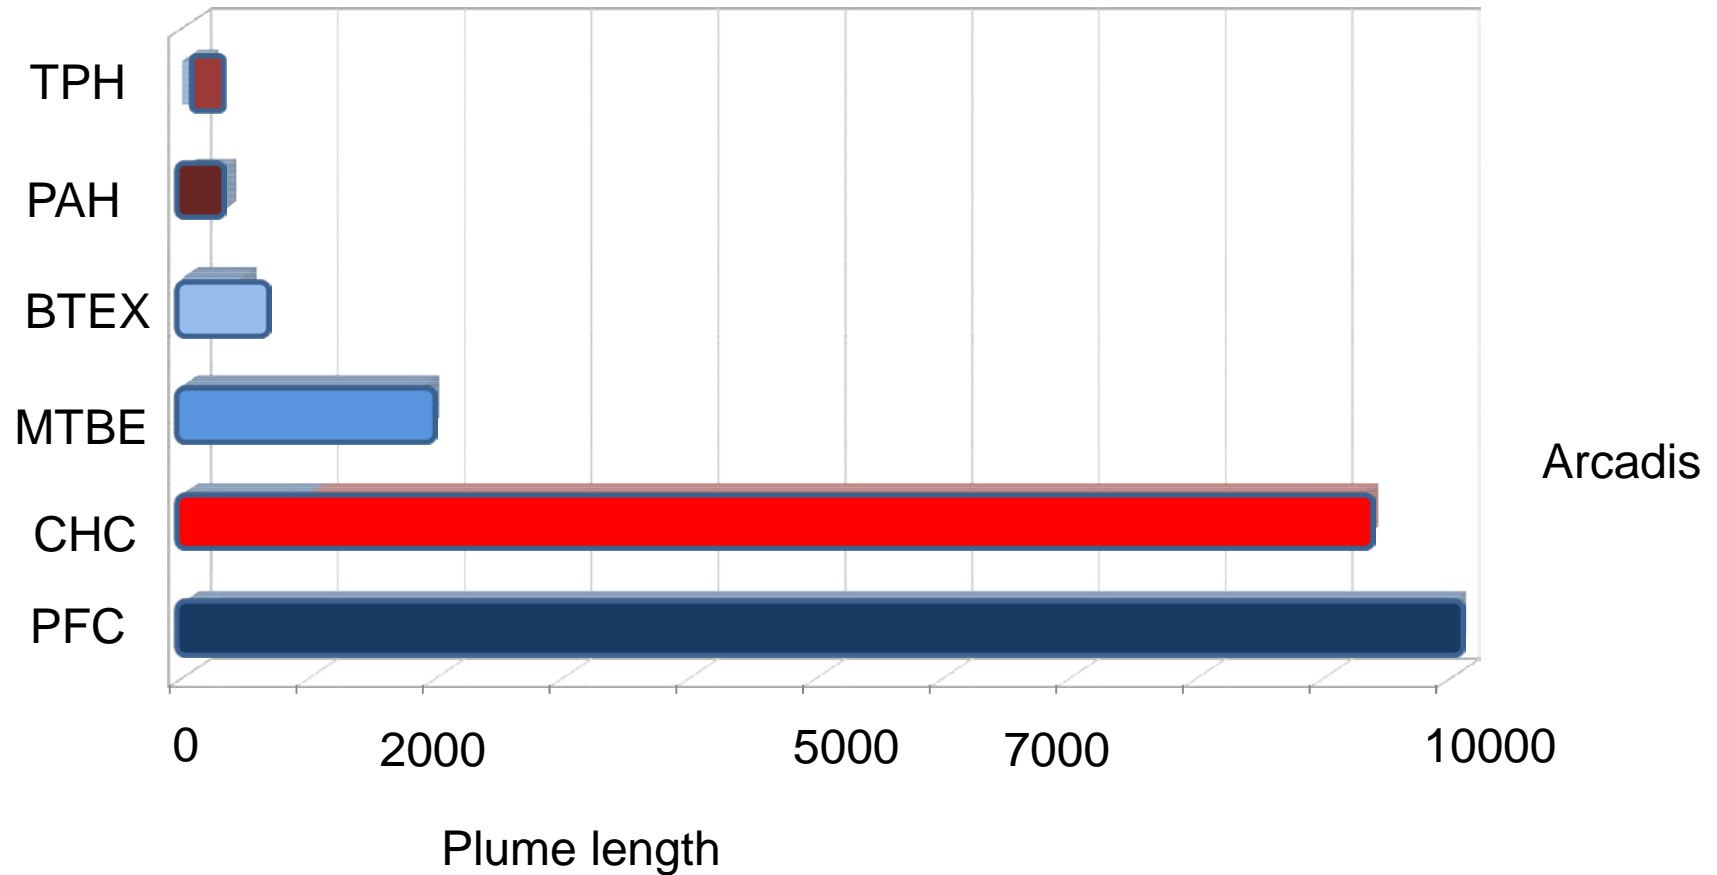

# FATE AND TRANSPORT OF PFCS

- Much is still unknown about these chemicals- CRC CARE researchers have been researching this using select soils from Australia since 2004
- PFCs are extremely stable
  - Do not hydrolyze, photolyze, or biodegrade under typical environmental conditions
  - Are extremely persistent in the environment
    - » For example the half-life (at 25° C) in water for PFOA and PFOS is > 92 years and > 41 years, respectively
- High potential to adsorb to substrates
- Migration depends upon groundwater flow and the charge of the substrate.

# EXTREMELY MOBILE ONCE IN GROUND WATER

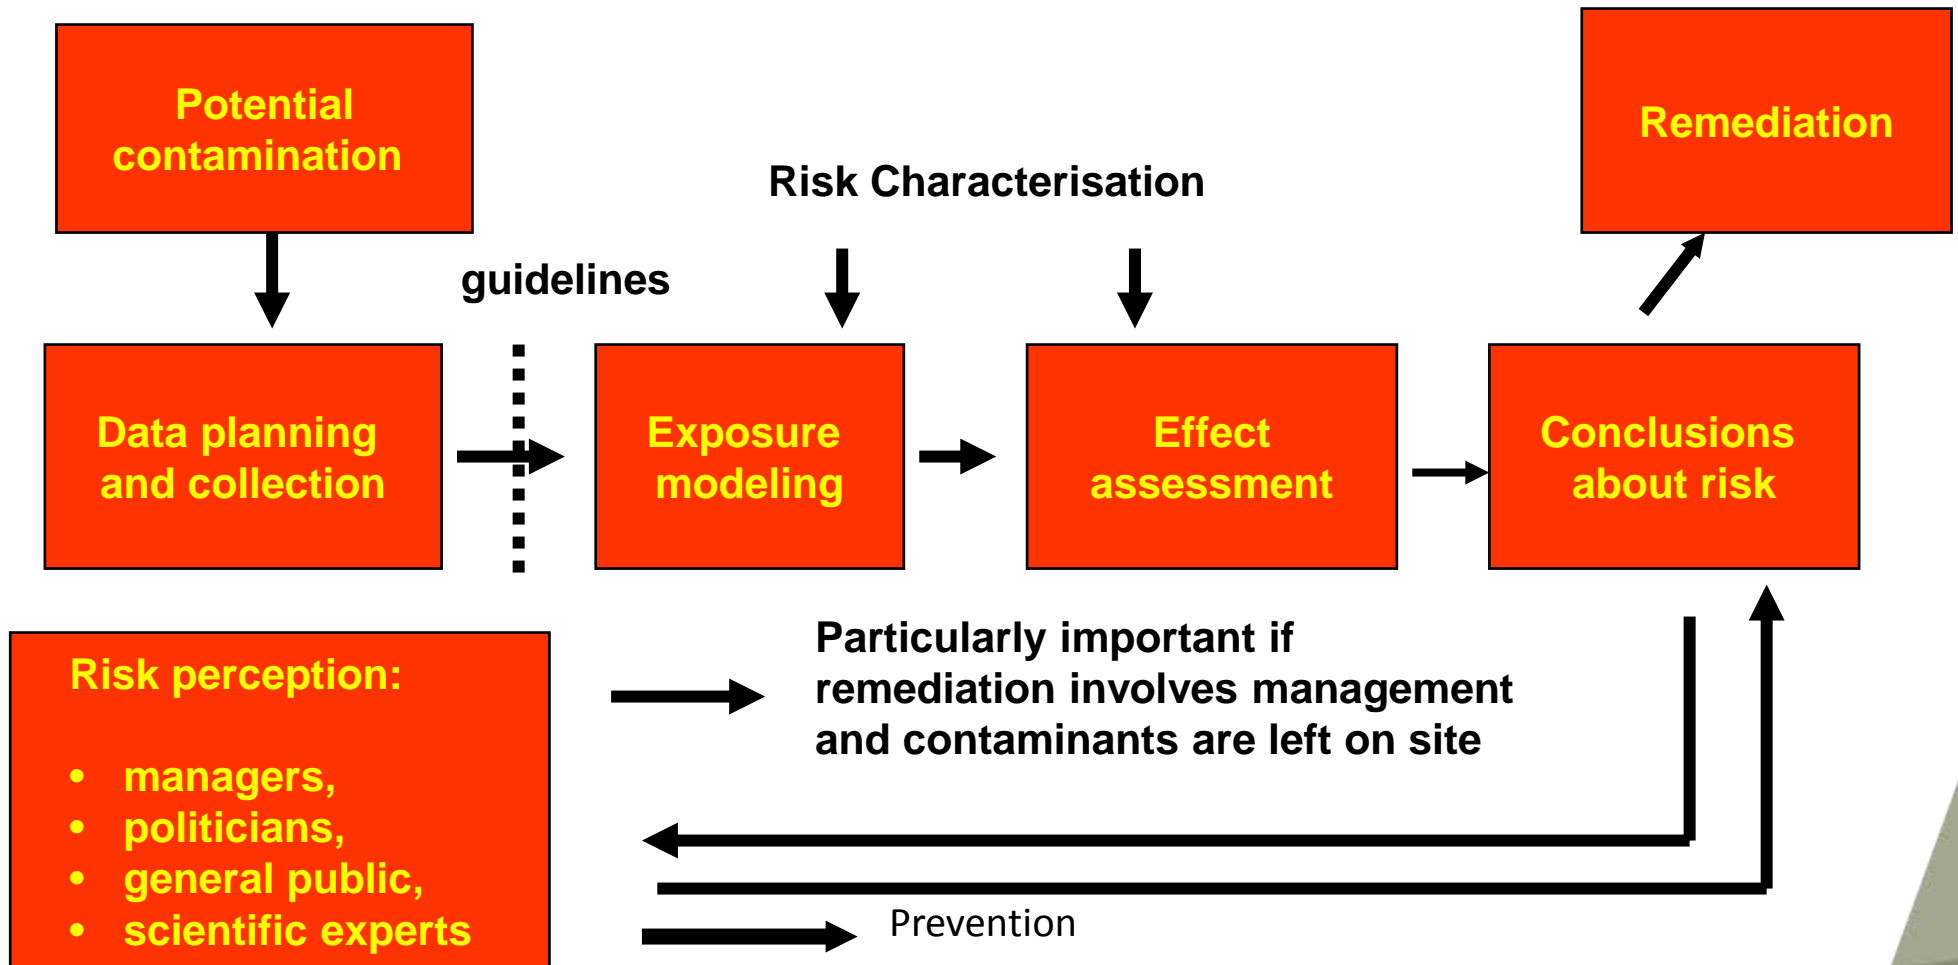

# PFCS: THRESHOLD VALUES

- US information (List 3 for future water quality regulations)
  - EPA Provisional short-term health guidance
    - PFOA 0.4 µg/L
    - PFOS 0.2 µg/L
- Netherlands National Institute for Public Health and the Environment (RIVM) (2010)
  - MPC of 0.65 nanograms per liter PFOS for freshwater
- No existing NEPM criteria.
- CRC CARE is developing guidance document

# Approach to Managing Contamination

# Exposure Pathways

- Groundwater to human
- Waste water-soil-crop-human
- Waste water-soil-human
- Waste water-soil-fodder-animal-human
- Waste water-soil-animal-human
- Groundwater-soil-human etc

# REMEDIATION: A MAJOR CHALLENGE

Extreme stability of strong carbon-fluorine (C-F) bonds make conventional remediation techniques ineffective (Mak et al., 2009).

- Oxidation/Photo Induced Oxidation
- Thermal Treatment
- Adsorption
- Membrane Filtration
- Sonochemical Treatment
- Chemical immobilization-CARE technology

## CASE STUDY COMMENT- Some comments

- Site: Hamilton International Airport-thermal treatment study
  - “Advanced oxidation processes, which utilize the hydroxyl radical,-- such as alkaline ozonation, peroxone (i.e., a mixture of  $O_3$  and  $H_2O_2$ ), or Fenton's reagent (i.e.,  $H_2O_2$  and  $Fe^{2+}$  salts)--have been shown to be relatively ineffective for PFOA and PFOS destruction.”

“If Hamilton uses public funds to test Nanozox™ on PFOS/PFOA, Hamilton will become a laughing stock in the scientific community”

..... Miller (2011) .....

# ADSORPTION

- Adsorption is a surface phenomenon that results in the accumulation of molecules within the internal pores of an activated carbon
- PFOS and PFOA molecules adhere to the surface of an adsorbent (e.g GAC) by partitioning and/or electrostatic interactions.

# ADSORPTION

## Advantages

- GAC adsorption technology consistently achieves PFOS removal of > 90% (Ochoa-Herrera and Sierra-Alvarez, 2008).

## Disdvantages

- GAC can be ineffective at removing PFOA and other PFCs (Oliaei and Kessler, 2006).
- Slow kinetics (> 72 hours to reach equilibrium).
- For water- may be necessary to operate pump-and-treat systems for many years to meet clean-up goals (Hawley et al., 2012; Paterson, 2012).

# Nano materials

- Used in remediation of contaminated soils
- Inexpensive risk based approach

New materials developed

\$\$\$\$\$

- Efficient
- Durable
- Cheap raw materials
- Easy regeneration
- Value added product from natural materials

- Clay/nano-material based remediation materials can effectively adsorb contaminants both in water and soil environments.
- Easy to develop catalysts.
- Potential to develop value added products from the natural clay resources.

# AFFF CONTAMINATED WATER REMEDIATION-

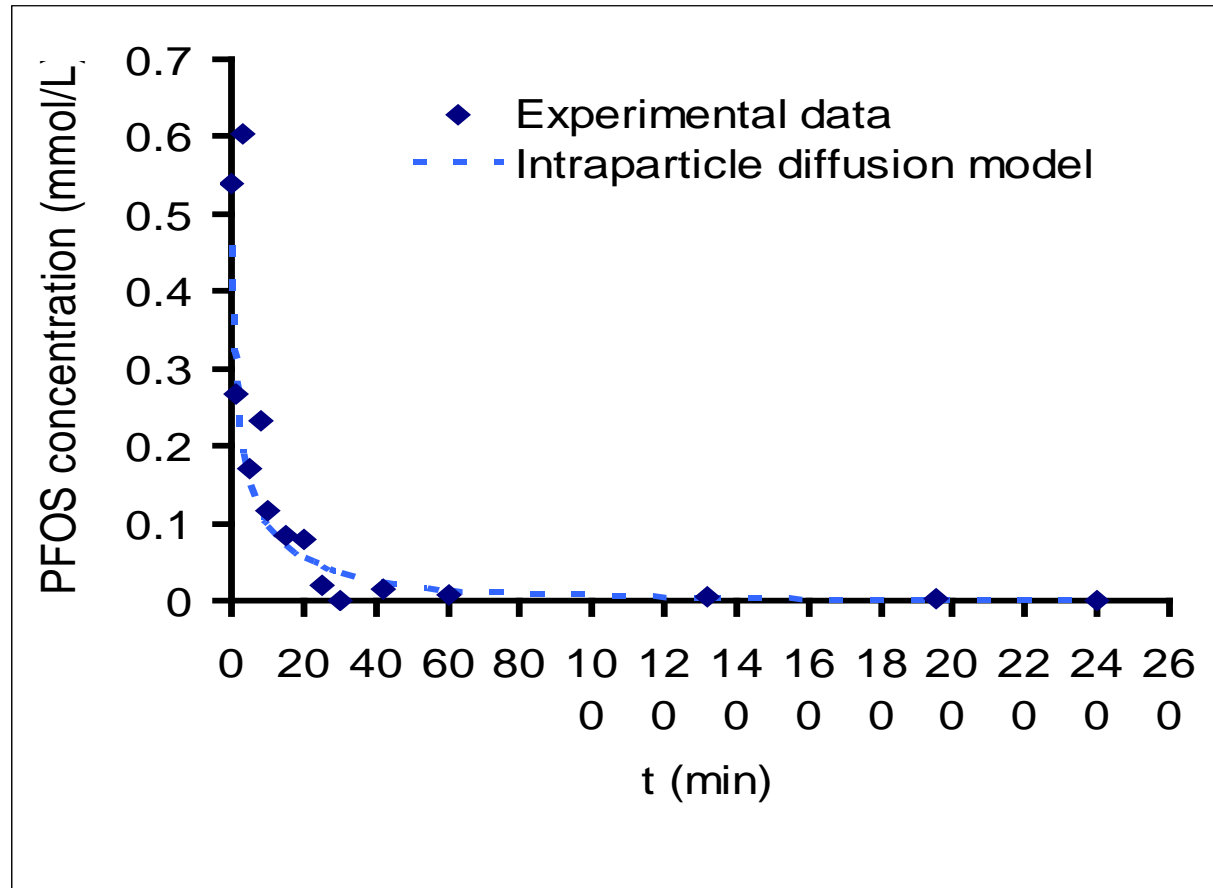

- Develop modified natural material with capacity to immobilize PFCs
- Asses the ability of modified material to immobilize PFCs - optimization the process
- Scale up the technology
- Transfer to field

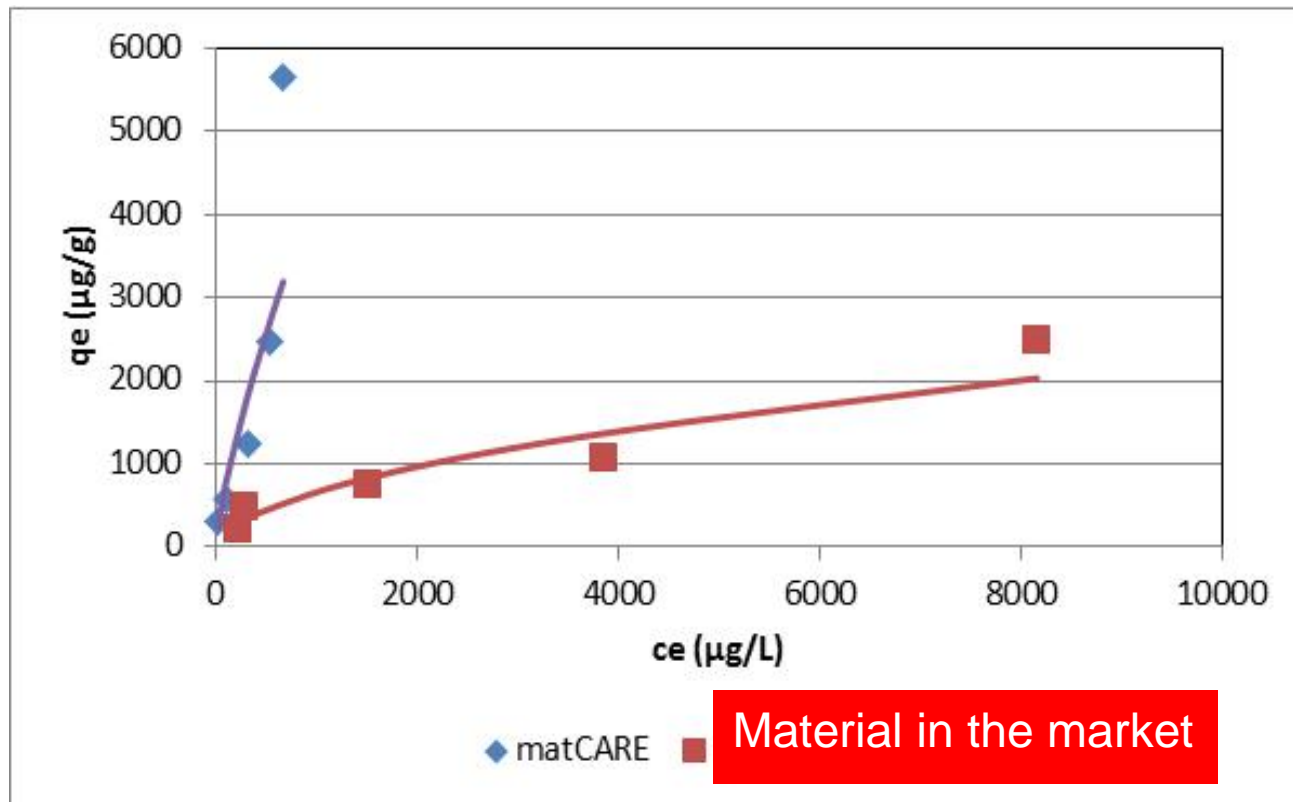

# PFOS/PFOA WASTE WATER REMEDIATION

Matcare™

# MATCARE is far superior to material commercially available

matCARE is reliable, cost effective and superior to other technologies

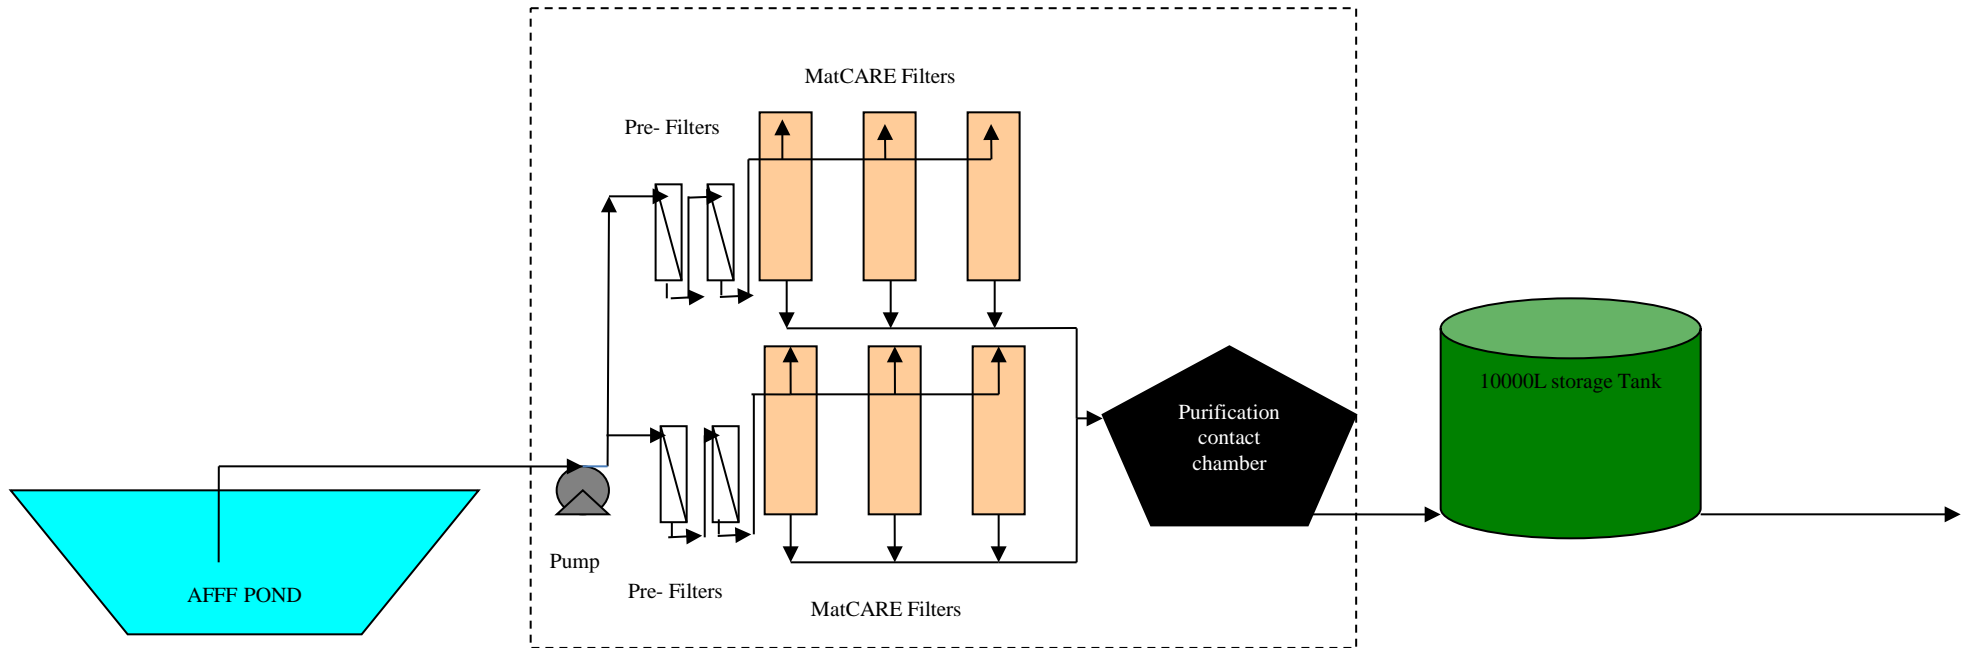

# WASTE WATER TREATABILITY IN LAB

Perfluorinated compounds	Before treatment (µg/L)	After treatment (µg/L)
PFOS	75.8	<0.02
PFOA	2.77	<0.02
6:2 Fluorotelomer sulfonate (6:2 FtS)	508	<0.1
8:2 Fluorotelomer sulfonate	15.2	<0.1
PFOSA	<0.20	<0.02

Samples used for batch studies was also tested in column studies. The data obtained confirmed that four columns in series filled with matCARE™ successfully treated the wastewater to limits below detection for both PFCs and Petroleum Hydrocarbons.

# SCHEMATICS OF THE WASTE WATER REMEDIATION TECHNOLOGY

Upgraded AFFF Remediation Plant

# WASTE WATER REMEDIATION PLANT

# Wastewater remediation (AFFF) – 2.2ML remediated

Wastewater pumped into  
the reactors

prior to aquifer injection

Wastewater

Clean water

# AFFF WASTEWATER REMEDIATION PLANT ON WHEELS

# TECHNOLOGY SET UP

- Shipping container is used to set up technology
- Containization presents many advantages including:
  - Limited civil works (only container foundation is required)
  - Fast implementation, and
  - Mobility

## 2012 data Edinburgh RAAF base AFFF WWTP

# AFFF plant performance

Inlet PFOS (mg/l)	Outlet PFOS (mg/L)	PFOS removed (%)	Inlet PFOA (mg/L)	Outlet PFOA (mg/L)	PFOA removed (%)	Volume treated (L)
11.58	<LOR	>99.9>	1.65	<LOR	>99.7	>2,000,000

Note: LOR=Limit of Report (2µg/L); Average values over 2 years were taken.

# Conclusions

- The AFFF plant built next to the dam containing contaminated waste water has successfully treated in excess of 1,000,000L of contaminated water to a level below the limit of reporting (LOR), which is 2µg/L .
- More than 99% of AFFF (PFOS 99.7% and PFOA 98.8%) has been removed from the wastewater.
- Transportable design presents a number of advantages.

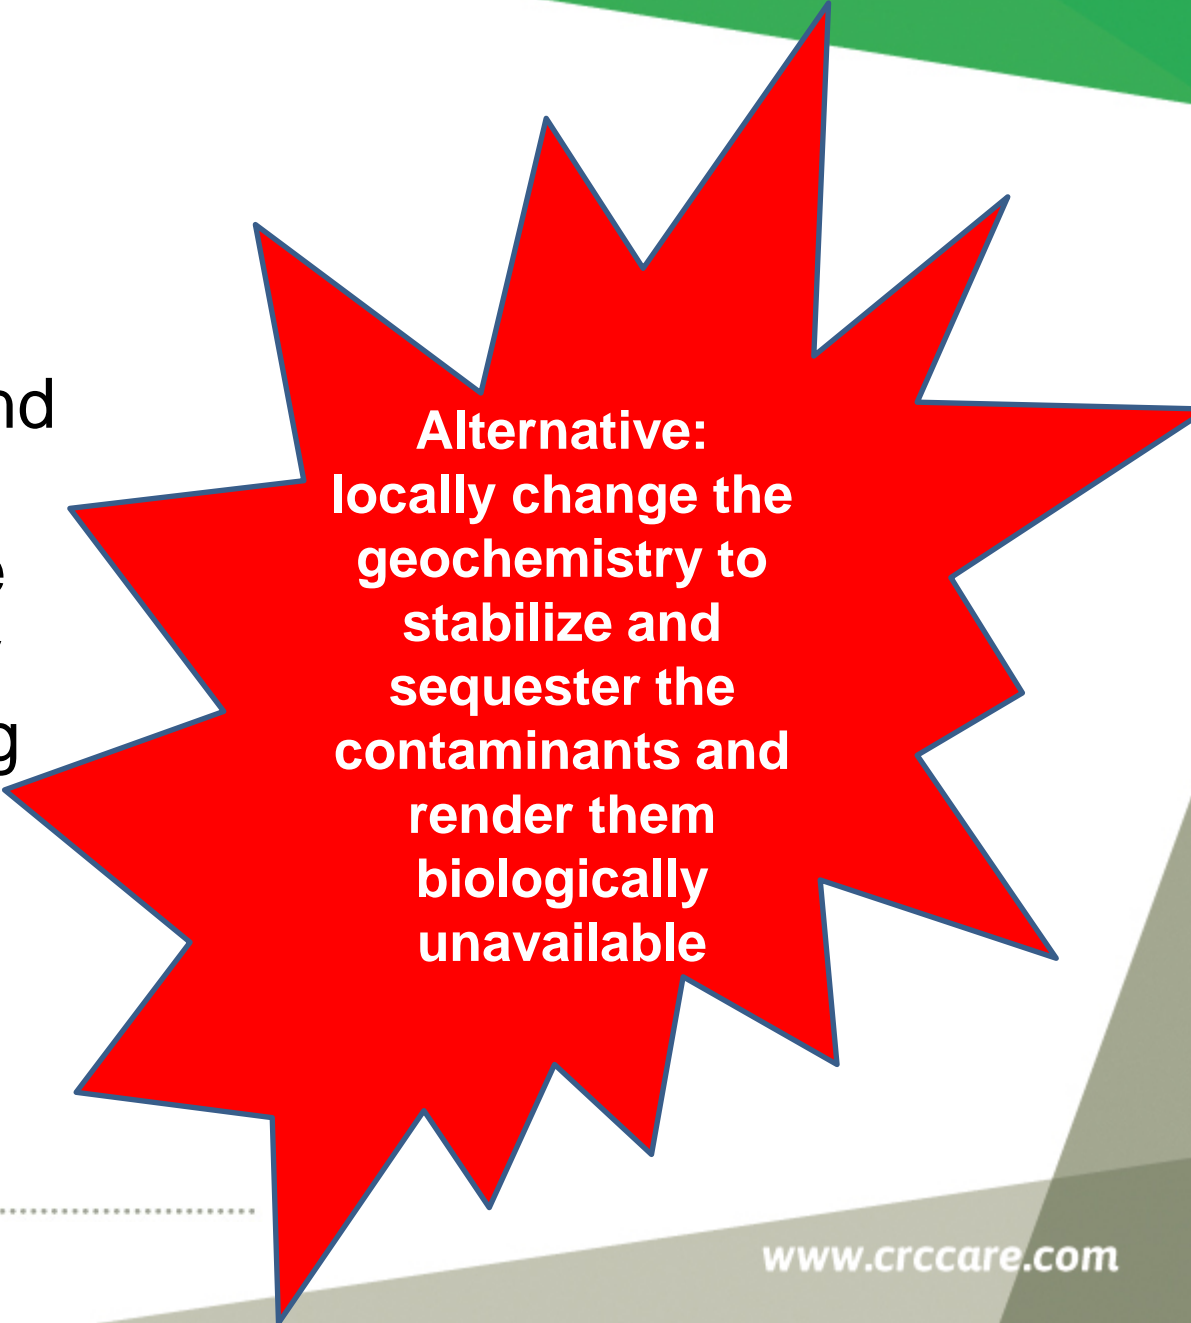

# AFFF CONTAMINATED SOIL REMEDIATION

## Objective of remediation

- Reduce the actual or potential environmental threat and
- Reduce unacceptable risks to man, animals and the environment to acceptable levels (Wood, 1997)

- Removal of risk by physical means (dig and dump) which can be prohibitively expensive and may not ultimately prove effective- leaving for future generations

**Alternative:  
locally change the  
geochemistry to  
stabilize and  
sequester the  
contaminants and  
render them  
biologically  
unavailable**

# RISK REDUCTION

“Could be low cost, in situ management and hence most attractive remediation technique-

Key to risk reduction: development of techniques that enable significant bioavailability reduction and this must be reliable and sustainable over long-term”

**Regulator requirement: outcome fulfils NEPM  
using OECD and other regulatory tests**

# AFFF SOIL AND WATER REMEDIATION- CHEMICAL IMMOBILIZATION: CRC CARE

- Develop modified natural material with high capacity to immobilize PFCs
- Assess the ability of modified material to immobilize PFCs- optimization the process
- Investigate the release characteristic of the immobilized PFCs
- Investigate bioavailability of PFCs in treated soils

# AFFF SOIL REMEDIATION- BIOAVAILABILITY REDUCTION

Strategies to immobilize PFOS in the impacted soils.

Minimise exposure by reducing contaminant bioavailability,

Can this be achieved via immobilisation of PFCs in AFFF contaminated soils? = a risk based approach

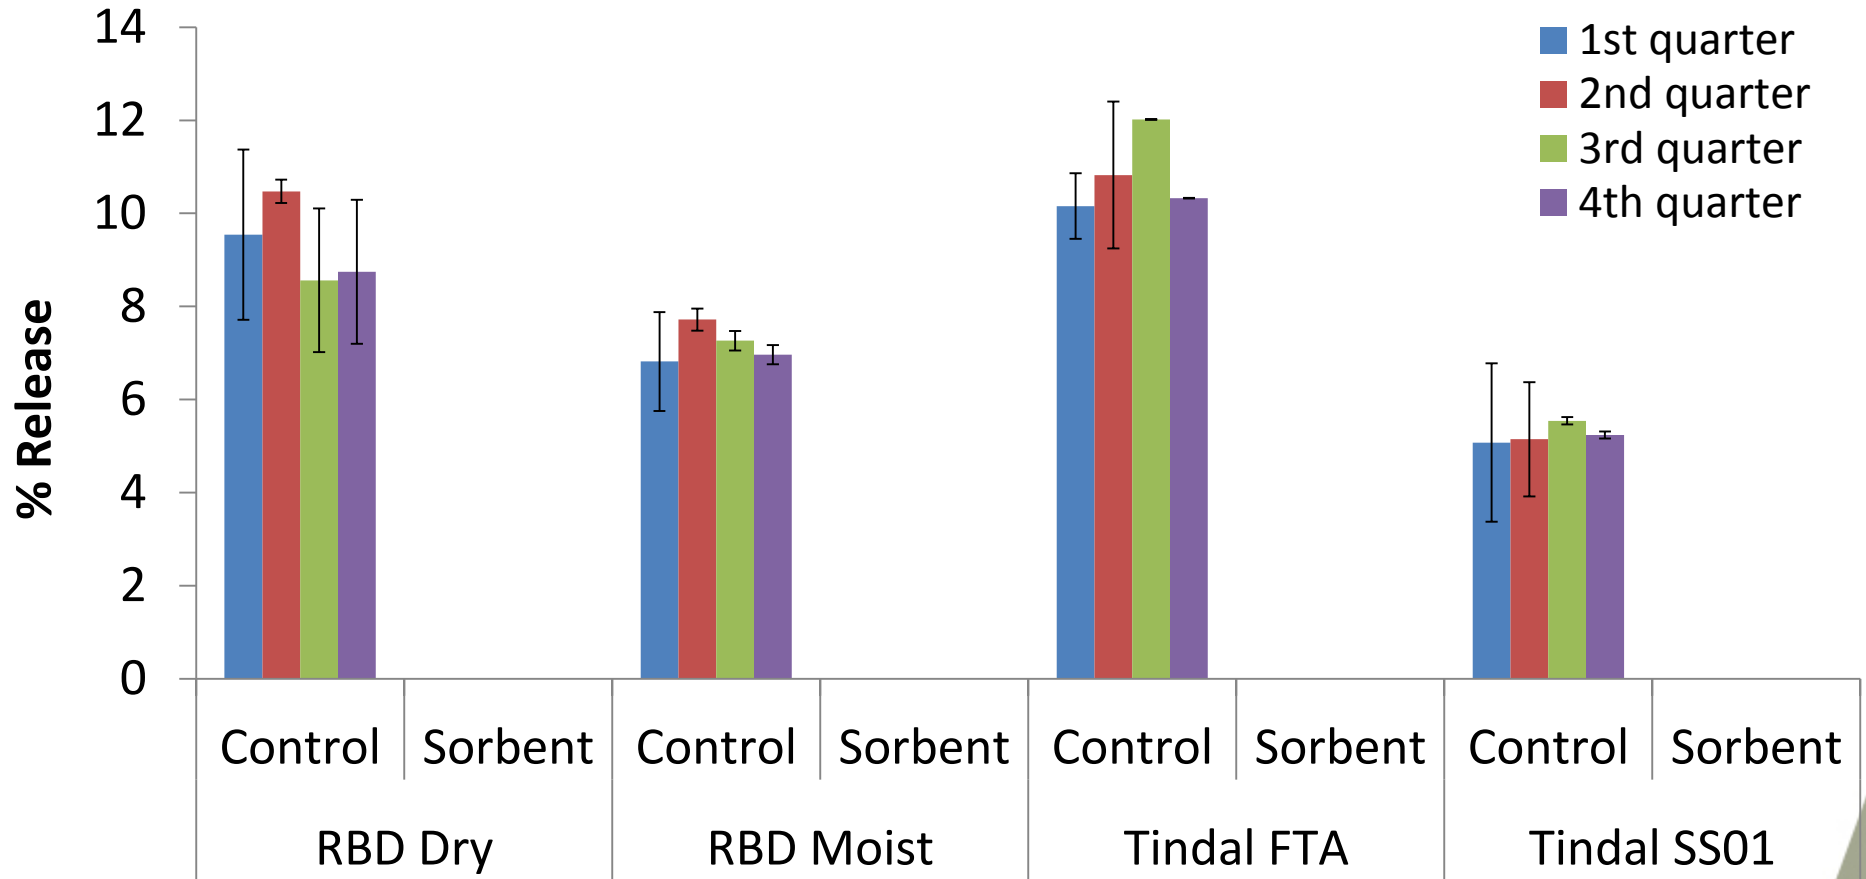

## PFOS CONTENT OF SOILS

Soil	PFOS concentration ( $\mu\text{g/g}$ dry soil)	
	water extract	solvent extract
Brown (Dry) RBD	0.26	1.83
Brown (Water logged) RBD	10.57	74.38
Red Tindal FTA 064,SB04	2.36	16.17
Black Tindal SS01	0.93	9.26

# MODIFIED CLAY TREATABILITY STUDY- FIELD CONTAMINATED SOILS

# TIME DEPENDENT DESORPTION OF PFOS FROM SOILS TREATED WITH MATCARE

# FIELD REMEDIATION- PFOS IN UNTREATED SOILS

HPCD extractions

# EFFECT OF IMMOBILIZATION ON EARTHWORM SURVIVAL AND UPTAKE IN TREATED SOILS

- Field soils treated with MatCARE allowed to react for 120 days were exposed to worms.
- Weight loss monitored
- Worm tissues solvent extracted

**No sign of  
avoidance in  
treated soils- no  
bioaccumulation  
No mortality**

# SUMMARY AND CONCLUSIONS

- Remediation technologies investigated have delivered mixed outcomes;
  - Majority of technologies were unsuccessful in remediating of PFCs from waste water;
  - At best tested technologies could remove <90% of PFCs.
  - Ineffectiveness of the technologies were attributed to the extreme stability of strong carbon-fluorine (c-f) bonds

## SUMMARY AND CONCLUSIONS

- matCARE™ based technology has successfully remediated >2,000,000 l of waste water in the field at three separate locations;
- Bioavailability reduction- is an attractive strategy for managing PFCs contaminated soils - a risk based approach to managing AFFF contaminated soils.

# COST OF REMEDIATION

- Cost varies depending on the contaminant loading, nature of other contaminants in water and soil

“for every complex question there is  
a simple answer and its wrong”

..... HL Mencken
