

The nearby offshore Gippsland Basin, where carbon storage is being developed by CarbonNet, is recognised as a world-class location for this technology and infrastructure.

### **Conclusion**

A commercial HESC Project has potential to create thousands of jobs and help transition the region from coal fired power stations to new clean industries and create a thriving hydrogen export industry with huge local economic, environmental and community benefits.

Without the support of the Latrobe Valley and the Mornington Peninsula communities, the Victorian, Australian and Japanese Governments, this project would not be possible.

We remain committed to collaborating with State and Federal Governments to deliver jobs for Victorians and be part of the economy of the future.
